

Pipe Racks & Tubs

Strad delivers convenient and safe storage options for pipe, tubing, casing, and collars on a project site. Pipe racks are steel-framed structures where pipe is piled horizontally above ground. The triangular shape of them provides strength and stability when stacked on top of one another. Pipe tubs are used to make your project site safer, more practical and more efficient. They can be used to store pipe at the rig site or as a container for transporting pipe by truck or barge. The tubs can be rigid or built with a hydraulic lift table.

Rental, lease, or purchase options are available.

Features

- Stay safe and organized with racks and tubs on the project site
- Various sized racks available with round or square tubing design

Pipe Racks & Tubs Advantages

Pipe tubs can reduce your rig time and trucking costs, and decrease on-site accidents that may occur to personnel in contact with moving tubulars.
